NICOpress®

Securing our world since 1901

Catalog No. 40

Electical Power & Signal

Splicing Sleeves, Cable Rings, and Tools for Power & Rail

Electrical power and signal applications for more than 118 years

Since 1901, The National Telephone Supply Company has been manufacturing products for electrical power industry and signal applications. During this time Nicopress®, the registered trademark of our products, has earned a reputation for quality and dependable service. A perfectly integrated system, Nicopress® tools and sleeves have been specifically engineered, laboratory- and field-tested for dependability and longevity.

Safely securing our world

Nicopress® patented and engineered many of the connectors, swaging tools, and cable rings offered. We developed a connection system to secure customers' critical applications worldwide in industries that require efficiency, safety, reliability, and quality. We continually evaluate new solutions for challenging connections and terminations.

Dedication to quality and continuous improvement

Our Cleveland, Ohio USA operation is certified to ISO 9001:2015 with Design standard. This globally recognized certification of quality management system standards supports our commitment to create and maintain quality processes that ensure consistency, visibility, and accountability. The demanding certification and audit process demonstrate our dedication to provide the highest-quality standards in design, engineering, and product manufacturing that meet or surpass our customers' expectations.

Knowledgeable post sales service & support

Our design, engineering, and development team supports a wide range of Nicopress® products with extensive technical knowledge. Our team answers questions and provides after-sales service as part of our quality commitment. A wide range of detailed product information and educational literature is available for download on our website.

Nicopress® products are available worldwide on-demand. Nicopress® customers can rely on our quality products, service, and support. Our USA operation manufactures the majority of product we sell, and our knowledgeable team is available to answer questions and assist with global engineering challenges. In addition, 24-hour customer service is provided in storm situations.

Catalog organized in four main sections

Catalog 40 is divided into four main sections. The first two sections are splicing sleeves used by the power and signal industries. The next is cable rings and saddles which includes aerial cable suspension devices. Finally, the tool section outlines both our manual and power tools. The tabular layout of the catalog gives prominence to stock numbers and conductor sizes which facilitates the correct selection of Nicopress® sleeves, tools, and other parts.

NICOPRESS: Electrical Power

Copper and Copper Alloy Splicing Sleeves – Full Tension

Nicopress® splicing sleeves are used to splice a broad range of sizes of copper, copper-covered steel, *Copperweld*® copper, galvanized steel, A, C, S, R, All-Aluminum, AAAC, and Amerductor. All Nicopress® sleeves are designed to assure perfection in physical and electrical requirements.

Electrical conductor splicing sleeves are designed to splice the following types of conductors: copper, copper-covered steel (*Copperweld*®), galvanized steel, and Amerductor. Full tension sleeves are made of high conductivity seamless copper or copper alloy tubing with a specially bonded inner bore coating to assure maximum holding power and conductivity. Each sleeve is marked with a catalog stock number, conductor size, and installation tool groove.

Splicing Sleeves for Solid Copper Conductor - Full Tension

SPECIFICATIONS

- Seamless high conductivity copper tubing
- Sleeves develop 95% or more of the rated breaking strength of the conductor in conformance with ANSI C119.4
- Specially bonded inner bore coating
- Rolled center constriction conductor stop

Galvanized Steel Splicing Sleeves – Full Tension

These sleeves are designed to splice galvanized steel, aluminum covered steel (*Alumoweld*®), and Amerductor conductors. Sleeves are made of high strength seamless steel tubing with a specially bonded inner bore coating to assure maximum holding power and conductivity. Full tension splices develop 100% of the rated breaking strength of the conductor. Each sleeve is marked with catalog stock number, conductor size, and installation tool groove.

Aluminum Splicing Sleeves – Full Tension

Electrical conductor splicing sleeves are designed to splice the following type of conductors: both solid and stranded aluminum and aluminum covered steel (*Alumoweld*®) conductor; ACSR, AAAC (6201-T81), and 5005. These full tension single piece sleeves are made of high conductivity seamless aluminum tubing and develop the maximum rated breaking strength of the conductor in conformance with ANSI C119.4 (where applicable). Each sleeve is marked with catalog stock number, conductor size, and installation tool groove.

Splicing Sleeves for Solid Aluminum Conductor - Full Tension

SPECIFICATIONS

- Seamless high conductivity aluminum tubing
- Sleeves develop 95% or more of rated breaking strength of the conductor in conformance with ANSI C119.4
- Treatment of inner bore with special coating to assure maximum holding strength
- Rolled center constriction conductor stop
- Wire brushing of conductor and use of splicing compound recommended

NICOPRESS: Electrical Power

SPECIFICATIONS
- Seamless high conductivity aluminum tubing
- Sleeves develop 100% of the rated breaking strength of the conductor in conformance with ANSI C119.4
- Treatment of inner bore with special metallic coating to assure maximum holding strength
- Rolled center constriction conductor stop
- Wire brushing of conductor and use of splicing compound recommended

ACSR Splicing Units – Full Tension

Aluminum splicing units are designed to splice ACSR conductor. Each splicing unit consists of two parts, an inner core wire splicing sleeve and a larger cover sleeve. The core sleeve is made from high strength galvanized seamless steel tubing and the outer cover sleeve is made from high conductivity seamless aluminum tubing. The larger aluminum cover sleeves have two filler holes with plugs which allow the injection of splicing compound prior to pressing. Two-piece units are designed to develop 95% of the rated breaking strength of the conductor in conformance with ANSI C119.4. Each Sleeve is marked with catalog stock number, conductor size, and installation tool groove for both the core and cover sleeve.

Splicing Units for ACSR Conductor - Full Tension (Unit Sleeves)

SPECIFICATIONS

- Inner core sleeve is made from electrogalvanized seamless steel tubing
- Outer cover sleeve is made from seamless high conductivity aluminum tubing
- Unit sleeves develop 95% or more of rated breaking strength of the conductor in conformance with ANSI C119.4
- Specially bonded inner bore coating in core sleeve only
- Rolled center constriction wire stop in core sleeve only
- Wire brushing of conductor and use of splicing compound recommended
- Catalog stock numbers, conductor size, and installation tool groove marked on sleeves. (These stock numbers describe a complete ACSR splicing unit. However, core and cover sleeves can be ordered separately by indicating the catalog stock number followed by the designation "core sleeve only" or "cover sleeve only.")

Aluminum Splicing Sleeves and Units – Partial Tension

These partial tension sleeves and units are designed to splice the neutral of self-supporting service drop cables (triplex) and short span overhead distribution lines. There are two types of these sleeves. The single piece sleeve is made of high conductivity seamless aluminum tubing. The two-piece unit consists of an inner core wire splicing sleeve and a larger cover sleeve. The core sleeve is made from high strength galvanized seamless steel tubing and the cover sleeve is made from high conductivity seamless aluminum tubing. Each sleeve is marked with catalog stock number, conductor size, and installation tool groove.

Splicing Sleeves for ACSR Conductor - Partial Tension

Aluminum Jumper (Loop) Splicing Sleeves

Nicopress® jumper sleeves are designed for the loop splicing of both solid and stranded conductor. These partial tension sleeves are made of high conductivity seamless aluminum tubing and meet the Class II requirements of ANSI C119.4. Each capped sleeve is marked with catalog stock number, conductor size and installation tool groove.

Jumper (Loop) Sleeves for Stranded All Aluminum Conductor (Concentric, Compressed, and Compact) - Partial Tension

SPECIFICATIONS

- Seamless high conductivity aluminum tubing
- Sleeves develop Class II Partial Tension Requirements in conformance with ANSI C119.4
- Inner bore filled with special oxide inhibiting compound
- Solid staked center barrier

NICOPRESS: Electrical Power

Reducing Sleeves

Nicopress® reducing sleeves are used when it's necessary to splice two wires of different sizes. A broad range of sizes are manufactured for copper, copper covered steel, aluminum and galvanized steel wires, also combinations thereof.

Nicopress® reducing sleeves are designed for jumper splicing applications involving the joining of two different size conductors. Both ends of these sleeves are pressed in the same tool groove. Reducing sleeves are made of high conductivity seamless metal tubing with a specially bonded inner bore coating. Each sleeve is marked with catalog stock number, conductor size, and installation tool groove.

SPECIFICATIONS
- Seamless high conductivity copper tubing
- Specially bonded inner bore coating
- Rolled center constriction conductor stop

Repair Sleeves – Full Tension

Nicopress® repair sleeves (tubular type) are for use on solid conductors to replace defective twist splices without changing the sag of the line. The practice of using a short piece of conductor and two splicing sleeves is eliminated by using the single repair sleeve which is long enough to span the gap made when cutting out the defective splice.

Nicopress® tubular repair sleeves are designed to reclaim and repair defective sections of power conductor. By removing the damaged section of conductor and splicing in a Nicopress® repair sleeve, the line wire can be repaired without changing the sag. The re-splicing of an old line wire with Nicopress® repair sleeves will eliminate noisy lines, weak signals, and poor transmission. These full tension splices are designed to develop 95% or more of the rated breaking strength of the conductor and are made of high conductivity seamless metal tubing with special metallic inner bore coating. Each sleeve is marked with catalog stock number, conductor size, and installation tool groove.

Repair Sleeves for Solid Copper Conductor

SPECIFICATIONS
- Seamless high conductivity tubing
- Sleeves develop 95% or more of the rated breaking strength of the conductor in conformance with ANSI C119.4
- Treatment of inner bore with special metallic coating
- Offset rolled center constriction conductor stop at one end

NICOPRESS: Electrical Power

Split Repair Sleeves – Full Tension

Nicopress® repair sleeves (split type) are for use on stranded conductors when some of the strands are damaged or broken. The installation restores the strength and conductivity of the conductor and the split feature eliminates any necessity of cutting and re-splicing the line. The repair sleeve also is used as a seat for hot-line clamps.

Nicopress® split repair sleeves are split their entire length so they can be slipped over damaged or broken wire sections of conductors. Installation of split repair sleeves restores the original conductivity of the conductor and 95% of the breaking strength of the conductor. This is true even when one third of the conductor wires are broken. These sleeves are made of high conductivity metal and may be used as a seat for hot line clamps. Each sleeve is marked with a catalog number, conductor size, and installation tool groove.

SPECIFICATIONS

- High conductivity extruded copper and copper alloy
- Sleeves develop 95% or more of the rated breaking strength of the conductor
- Inner surfaces specially coated to assure optimum holding strength

NICOPRESS: Electrical Power

Nicotap® Sleeves

Nicotap® sleeves are designed to tap into the main conductor without cutting the conductor. Nicotap® sleeves are first attached to the tap wire, and following this, the open end of the Nicotap® sleeve is pressed onto the line conductor using standard Nicopress® tools. Nicotap® sleeves assure the uninterrupted conductivity of the line conductor while providing excellent electrical tap. These sleeves are made of high conductivity copper with a specially bonded inner bore coating.

SPECIFICATIONS
- High conductivity copper
- Inner surfaces specially coated to assure optimum holding strength

Offset Dead-End Sleeves – Full Tension

Full tension offset dead-end assemblies are used to terminate conductors on pin, knob, spool or strain insulators. This sleeve is designed to allow the fabrication of a loop of any desired size for connecting to dead-end fixtures using standard Nicopress® tools. It also permits the feed through of a tail of conductor which can be spliced to other conductors. This Nicopress® sleeve is made of high strength seamless metal tubing with specially bonded inner bore coating. Each sleeve is marked with catalog stock number, and installation tool groove.

SPECIFICATIONS
- Seamless copper alloy
- Specially bonded inner bore coating

Suspension Dead-End Sleeves (Clevis Type) – Full Tension

Nicopress® suspension dead-ends are for use in dead-ending conductors on suspension insulators or on neutral-wire eye-bolts. The conductor feeds straight through. This fact, plus the unique design, not only insures a full-strength dead-end, but one that also has remarkable resistance to vibration fatigue. The design also permits a tail of any length where needed for connecting to other lines or apparatus.

Nicopress® suspension dead-end sleeves are designed for the termination of conductors on suspension insulators or on neutral wire eye bolts using standard Nicopress® tools. A tail of conductor may be fed thru this sleeve. This feed-thru design permits any desired length of conductor to be spliced to other lines or fixtures. These full tension sleeves are made of high strength seamless metal tubing with a specially bonded inner bore coating. The clevis and pin are made of hot dipped galvanized steel. Each sleeve is marked with catalog stock number, conductor size, and installation tool groove.

SPECIFICATIONS
- Seamless copper and copper alloy tubing
- Sleeves develop 95% or more of the rated breaking strength of the conductor
- Specially bonded inner bore coating

NICOPRESS: Electrical Power

Solder Sweated Split Tinned Copper Connectors

Split tinned sleeves are used for the non-tension solder splicing of underground power cable. These sleeves are designed for use with concentric, compact, or sector compact cables. Tin coated copper material and split design facilitate easy soldering and a good flow of solder into the splice. Smoothly rounded edges assure the uniform distribution of electrostatic stresses.

Solder Sweated Split Tinned Copper Connectors for Splicing Underground Power Conductor

SPECIFICATIONS

• Seamless high conductivity aluminum tubing • Specially bonded inner bore coating • Rolled center constriction conductor stop

Splicing Sleeves

Signal splicing sleeves are designed to butt-splice the following types of solid wire: copper, copper covered steel (*Copperweld*®), galvanized steel, and aluminum covered steel (*Alumoweld*®). Sleeves are made of high conductivity seamless metal tubing with specially bonded inner bore coating to assure maximum holding power and conductivity.

Splicing Sleeves for Solid Copper Wire

SPECIFICATIONS
- Seamless high conductivity copper or copper alloy tubing
- Specially bonded inner bore coating
- Rolled center constriction wire stop
- Catalog stock number, wire size, and installation tool groove marked on sleeve where applicable

Reducing Sleeves

Nicopress® reducing sleeves are designed for splicing applications involving the joining of two different size wires. Both ends of these splicing sleeves are pressed in the same tool groove. Reducing sleeves are made of high conductivity seamless copper and copper alloy tubing with a specially bonded inner bore coating. Sleeves used to splice galvanized steel wire are electrogalvanized. Each sleeve is marked with catalog stock number, wire sizes, and installation tool groove where applicable.

NICOPRESS: Signal

Nicotap® Sleeves

Nicotap® sleeves are designed to tap into the main line wire without cutting the wire. The Nicotap® sleeve is first attached to the tap wire and following this the open end of the Nicotap® is pressed onto the line wire using standard Nicopress tools. Nicotap® sleeves assure the interrupted conductivity of the line wire while providing an excellent electrical tap. Sleeves for splicing copper and (*Copperweld*®) wire are made of high conductivity copper; sleeves for splicing galvanized steel wire are made of electrogalvanized high conductivity copper; sleeves for splicing aluminum wire are made of high conductivity aluminum alloy. Each sleeve has a specially bonded inner bore coating to assure maximum holding strength.

NICOPRESS: Signal

Offset Dead-End Sleeves – Full Tension

Nicopress® offset dead-end sleeves are for use in dead-ending conductors on pin, knob, spool or strain insulators. This simple device, applied with the same Nicopress® tool used for splicing, provides a dead-end which is stronger than the line itself. The design also permits a tail of any length where needed for connecting to other lines or apparatus.

Full tension offset dead-end assemblies are used to terminate signal wire on pin, knob, spool or strain insulators. This sleeve is designed to allow the fabrication of a loop of any desired size for connecting to dead-end fixtures using standard Nicopress® tools. It also permits the feed thru of a tail of wire which can be spliced to other wires. This Nicopress® sleeve is made of high strength seamless metal tubing with specially bonded inner bore coating. Offset dead-end sleeves are used in the following wire and sleeve combinations: for solid copper wire and solid copper-covered steel (*Copperweld*®) wire the sleeves are made of seamless copper alloy electrogalvanized steel tubing; and for solid aluminum covered steel (*Alumoweld*®) the sleeves are made of seamless aluminum alloy tubing. Each sleeve is marked with catalog stock number and installation tool groove.

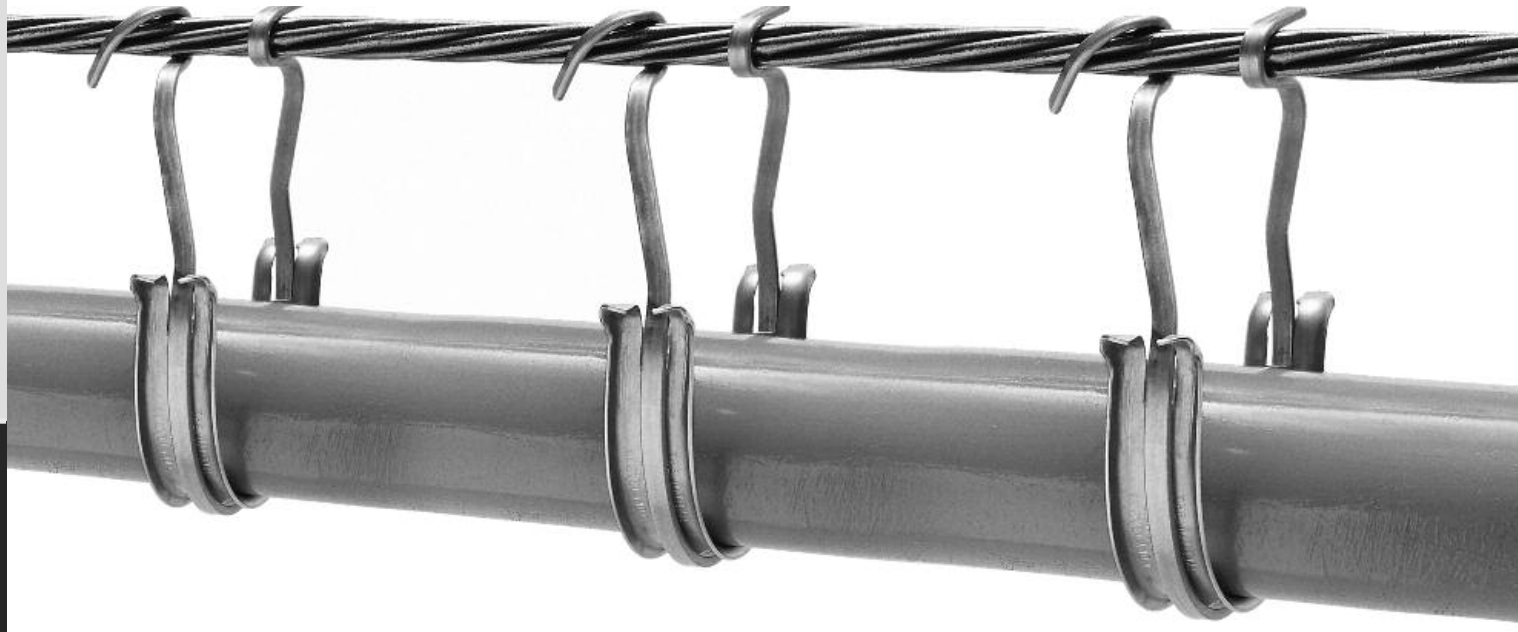
NICOPRESS: CABLE RINGS & SADDLES

The National Telephone Supply Company's cable rings and cable ring saddles answer the problem of supporting heavy electrical cables. Cable rings are designed to snap onto messenger stand and support aerial cable. The cable is suspended from the messenger strand by the cable ring. The integrity of the cable suspension system is based on multiple cable supports with each cable ring acting as an independent supporting unit.

Standard length cable rings are made for single cable suspension and "extra long" cable rings are designed for suspending a second cable underneath a standard length cable ring. In this manner one messenger strand will transport two cables.



Cable Rings

While the spacing of cable rings on messenger strands will vary to suit a particular installation and loading requirements, the table below offers a general guideline as to typical spacing.

CABLE RING SIZE - INCHES	RECOMMENDED SPACING (LOAD AREA) - INCHES		
	LIGHT	MEDIUM	HEAVY
2 1/2 & smaller	20	18	16
over 2 1/2	15	12	12

At railroad crossings or similar areas, spacing of rings is generally reduced to 12 inches. The Nicopress® cable ring's special roll form design and spring tension results in firm attachment of the cable ring to the messenger strand. Once in place the ring will not creep or move along the strand. Cable rings are made to withstand the most corrosive environments. Rings are available in several metal alloys and finishes including galvanized steel, PVC coated steel, copper covered steel (*Copperweld*®), and stainless steel. Since exposure to the elements can accelerate galvanic corrosion, we recommend selecting cable rings which will be compatible with the metal of the messenger strand. Consult the following table when making your selection:

TYPE OF CABLE RING	TYPE OF MESSENGER STRAND			
	GALVANIZED	ALUMINUM	COPPER	TYPE 316
Galvanized Steel	●	●		
PVC (Polyvinyl Chloride) Coated Steel	●	●		●
Copper Covered Steel			●	
Stainless Steel				●

Care should be taken to order the correct size of cable ring. In addition to the type of material always specify the "cable ring size," whether standard or extra long, and the "strand size". A cable ring is made to fit one strand size only. The size of the cable ring equals the diameter of the enclosed loop after the cable ring has been placed on the messenger strand. The diameter of the cable being supported should never exceed the capacity of the ring (enclosed loop). Note column heading marked "Maximum Cable Diameter."

NICOPRESS: CABLE RINGS & SADDLES

Cable Ring Saddles

Cable ring saddles are designed for use with cable rings and offer further versatility and durability in aerial cable suspension. The wide bearing surface provided by cable ring saddles gives better support to the cable. Saddles are often required to meet design factors such as cable weigh, armor, vibration and movement of the aerial cable.

When ordering, note that each size cable ring saddle is designed for use with a specific size cable ring. Saddles cannot be used interchangeably. Order saddles by specifying cable ring size, whether standard or extra long.

Cable ring saddles are made from galvanized steel, stainless steel, brass, and aluminum. The most compatible combination of metals between cable rings and cable ring saddles is indicated below.

RING/SADDLE COMBINATIONS

Cable Ring	Cable Ring Saddle
Galvanized Steel	Galvanized Steel
Stainless Steel	Stainless Steel
(*Copperweld*®)	Brass

NICOPRESS: TOOLS

Many types of Nicopress® tools are available for the compression of sleeves. Tools are shipped with detailed instructions showing the proper tool operation and adjustment, plus tool "GO" gauges for checking the accuracy of sleeve compressions. Nicopress® tools are engineered to create maximum metal flow of the splicing sleeve around the wire or conductor. This results in splices that are strong and reliable.

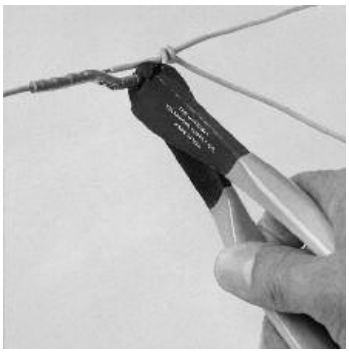
Before making a splice be sure you have the right tool or die for the specific size sleeve to be pressed. The sleeve and tool tables in this catalog facilitate the correct selection of matching tool and sleeve combinations. Note the column headings marked "tool groove." Matching the "tool groove" designations of the various tools and sleeves identifies the correct combinations.

Both Nicopress® tools and sleeves are marked with identifying stock numbers. This permits easy field identification.

Small Hand Tools

Tools for Signal Sleeves

STOCK NUMBER	GROOVES	LENGTH - INCHES	APPROX WT LBS
17-BA	A, B	8.25	0.7
17-B4-TC	B4	8.25	0.7



Toggle Action Tools

Engineered for field conditions, Nicopress® toggle action tools are made with drop forged steel jaws with specially-hardened working surfaces. Tools have either single- or multiple-marked pressing grooves. The tool groove markings match similar markings on corresponding Nicopress® sleeves. Metal "GO" gauges supplied with each tool help ensure the accurate compression of sleeves. Tool instructions provide for easy field adjustment of tools. These toggle action tools produce perfect splices with a minimum of handle force.

NICOPRESS: TOOLS

Battery Powered Compression Tools

Nicopress® battery-powered compression tools are for use with Nicopress® sleeves and dies. Ergonomic, one-handed operation tools that provide operator convenience to speed splicing tasks for repetitive swaging. The 5606 is useful in confined areas where traditional compression tools cannot be used (jaws rotate 360 degrees for ease of operation). The 5612 is designed specifically for overhead application, with a rotational head. *Cutting dies are available*.

5606 (6 ton)

Ergonomic one-handed operation tool that provides operator convenience to speed wire rope splicing tasks for repetitive aerial swaging. Its compact size and 360-degree rotation provide ease of operation. Crimp cycle time is less than 6 seconds with approximately 250 crimps per charge.

LED lights on both sides of tool

Dimensions	20.5"L x 4"H x 2.5"W (52.1cm x 12.2cm x 7.9cm)
Weight	8 lbs (3.6kg) w/battery
Wire Size	3/64" (1mm) to 3/8" (10mm)
Battery Pack	2 Lithium-ion
A/C Battery Charger	•
Molded Carrying Case	•
Wrist Strap	•
Approx No of Crimps	250
Approx Shipping Wt	19 lbs
Available 6 Ton Dies	See p 55 (top)

5612 Pistol-Grip (12 ton)

Battery-powered tool, with one-hand operation. Designed specifically for overhead application, with rotational head, rapid advance and an ergonomic pistol-grip handle.

Dimensions	16"L x 11.5"H x 3.5"W (41cm x 29cm x 9cm)
Weight	15.5 lbs (7.5kg)
Wire Size	3/64" (1mm) to 1/2" (13mm)
Battery	2 Lithium-ion
A/C Battery Charger	•
Molded Carrying Case	•
Wrist Strap	•
Approx No of Crimps	65
Approx Shipping Wt	30 lbs
Available 12 Ton Dies	See p 55 (bottom)

Hydraulic Tools

Nicopress® offers a series of hydraulic compression tools and dies designed to press a wide range of transmission and distribution line connectors, from 6 and 12 ton to 35 and 60 ton. Interchangeable tool dies will press copper, aluminum and steel splicing sleeves.

The hand operated 12 ton hydraulic compression tool features a two stage rapid advance pumping system. It's engineered to swage the full range of Nicopress® product up through ½" (12mm).

3512 Hydraulic Compression Tool w/Case (12 ton)

Dimensions	23"L x 6.5"H x 3.5"W (59cm x 16.5cm x 8.9cm)
Weight (tool)	13 lbs (6kg)
Wire Size	3/64" (1mm) to 1/2" (12mm)
Compression Output	12-ton
Available 12 Ton Dies	See p 55 (bottom)

3512-H Power Head only (w/Case) (12 ton)

Dimensions	9.5"L x 5.25"H x 2.75"W (24.1cm x 13.3cm x 7cm)
Weight (tool)	8.5 lbs (3.9kg)
Wire Size	3/64" (1mm) to 1/2" (12mm)
Compression Output	12-ton
Available 12 Ton Dies	See p 55 (bottom)

3512-TG Pressure Test Gauge & Die Set (w/Case) **Weight** 9.5 lbs (4.3kg)

The 35 ton swaging tool is designed for a variety of markets and is the most versatile swager of its size. It's supplied with a manual pump and can be ordered with an electric hydraulic power unit.

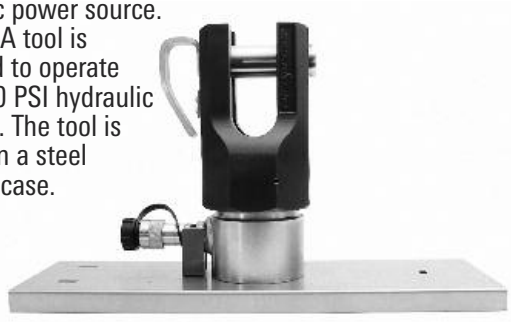
635 (35 ton)

Manual hydraulic compression tool, shipped complete with hand pump, mounted on a base, and packed in a carrying case. It can be ordered with an electric hydraulic power unit. The portability of this tool is an advantage in the field.

Dimensions	33"L x 13"H x 6.5"W (84cm x 16.5cm x 33cm)
Weight	73 lbs (33kg)
Approx Shipping Weight	82 lbs (37kg)
Wire Size	3/64" (1mm) to 5/8" (16mm)
Available 35 Ton Dies	See p 56 (top)

635-A (35 ton)

Power hydraulic compression tool head, shipped complete with quick disconnect coupling, six-foot hydraulic hose (#2696), and ready for hook up to hydraulic power source. The 635-A tool is designed to operate at 10,000 PSI hydraulic pressure. The tool is packed in a steel carrying case.



Dimensions	9"L x 13"H x 6.5"W (33cm x 16.5cm x 23cm)
Weight	45 lbs (21kg)
Approx Shipping Weight	75 lbs (34kg)
Wire Size	3/64" (1mm) to 5/8" (16mm)
Available 35 Ton Dies	See p 56 (top)

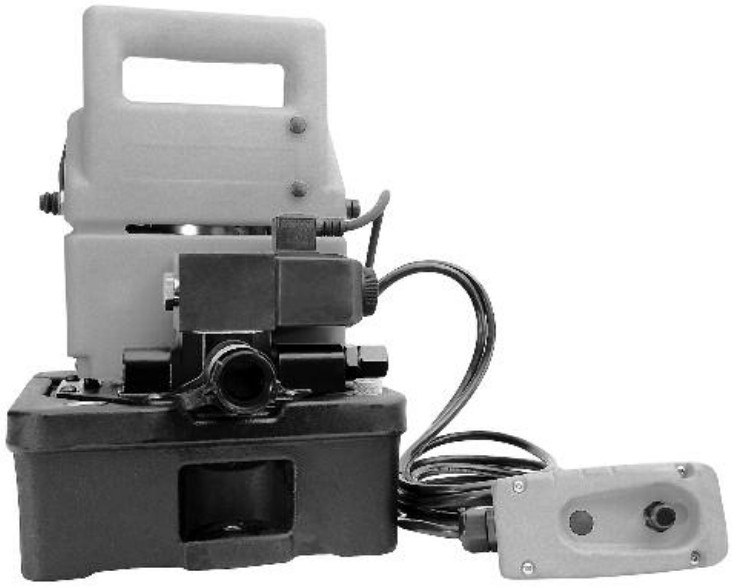
NICOPRESS: TOOLS

Electric/Hydraulic Power Source for 635-A & 3512-H

Optional electric hydraulic and pneumatic hydraulic power sources compatible with 12 ton 3512-H and 635-A hydraulic swaging tools. Engineered for both shop and field use when higher volume throughput is required.

NEH-1 Electric Pump

Power Source	115 volt, 60 HZ-AC
Dimensions	14.5"L x 15"H x 12.25"W
Approx Weight	33 lbs (15kg)
Hydraulic Output	20 cu in per minute at 9,200 PSI



Accessories for 635 Series Hydraulic Tools

Optional electric hydraulic and pneumatic hydraulic power sources compatible with 12 ton 3512-H and 635-A hydraulic swaging tools. Engineered for both shop and field use when higher volume throughput is required.

STOCK NUMBER	DESCRIPTION
2498 CABLE CUTTER	Cable Cutter Die for copper and aluminum conductors. 5/8" diameter maximum capacity.
2685 HOSE	6' conversion hose assembly for coupling No. 635 manual hydraulic tool to hydraulic power operation
2791 HOSE	12' conversion hose assembly for coupling No. 635 manual hydraulic tool to hydraulic power operation
2730 HOSE	6' hydraulic extension hose assembly for 635-A tool head
2740 HOSE	12' hydraulic extension hose assembly for 635-A tool head

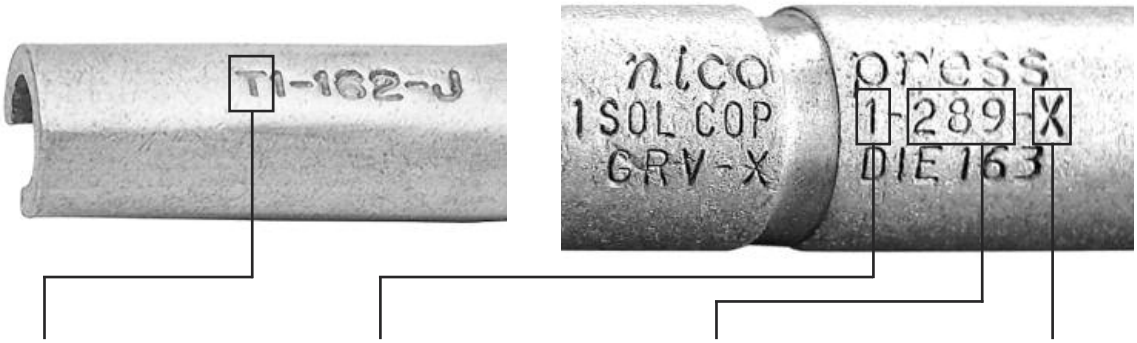
Part/Tool Numbering

Nicopress® Sleeves: power, signal, dead-ends, repair, and Nicotap®



Prefix position:

Applies to Power and Signal Dead-ends, Repair, and Nicotap® sleeves

TOOL GROOVE

Same naming convention as for the splicing sleeves, except that they have a prefix:

7	Suspension dead-end
9	Offset dead-end
AL	Aluminum Splicing Sleeves
AR	Split Repair Sleeves for Alum. Conductor
JU	Jumper Sleeves
R	Repair sleeve
T	Nicotap®

1st position:

SLEEVE MATERIAL

Signifies the material of which the sleeve is made:

1	Copper
2	Galvanized Copper
3	Brass/Copper
4	Brass/Copper
5	Galvanized Steel
8	Aluminum

2nd position:

WIRE/CONDUCTOR SIZE

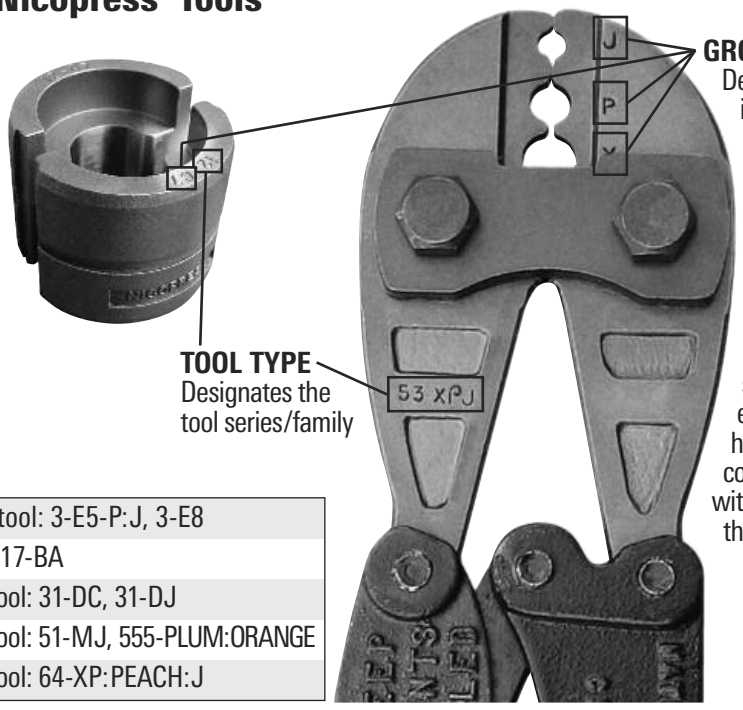
Represents the decimal equivalent of the diameter of the typical standard wire/conductor size to be spliced.

3rd position:

TOOL GROOVE

Denotes tool groove in which the sleeve must be compressed. Match this groove designation with the letter designation on the Nicopress tool. Tools are made to easily and quickly compress the appropriate sleeve. The letter designation on the Nicopress® sleeves makes it easy to identify which tool to use.

Nicopress® Tools



GROOVES
Denotes the groove(s) in the tool.

The grooves are clearly marked on every tool. A particular groove will accommodate all sleeves having the same letter at the end of the sleeve stock number. For example, any tool having a P groove will compress any sleeve with a stock number that ends with a P.

TOOL TYPE
Designates the tool series/family
